# 1 Package keyczar

Keyczar Cryptography Toolkit

Collection of tools for managing and using cryptographic keys. Goal is to make it easier for developers to use application-layer cryptography.

**Authors:** arkajit.dey@gmail.com (Arkajit Dey), steveweis@gmail.com (Steve Weis)

## 1.1 Modules

- **errors:** Contains hierarchy of all possible exceptions thrown by Keyczar.  
(Section 2, p. 3)
- **keyczar:** Collection of all Keyczar classes used to perform cryptographic functions: encrypt, decrypt, sign and verify.  
(Section 3, p. 13)
- **keyczartool:** Keyczartool is a utility for creating and managing Keyczar keysets.  
(Section 4, p. 25)
- **keydata:** Encodes the two classes storing data about keys:  
(Section 5, p. 26)
- **keyinfo:** Defines several 'enums' encoding information about keys, such as type, status, purpose, and the cipher mode.  
(Section 6, p. 30)
- **keys:** Represents cryptographic keys in Keyczar.  
(Section 7, p. 35)
- **readers:** A Reader supports reading metadata and key info for key sets.  
(Section 8, p. 53)
- **util:** Utility functions for keyczar package.  
(Section 9, p. 56)

## 2 Module keyczar.errors

Contains hierarchy of all possible exceptions thrown by Keyczar.

**Author:** arkajit.dey@gmail.com (Arkajit Dey)

### 2.1 Class KeyczarError

**Known Subclasses:** keyczar.errors.BadFormatError, keyczar.errors.BadVersionError, keyczar.errors.Base64DecodingError, keyczar.errors.InvalidSignatureError, keyczar.errors.KeyNotFoundError, keyczar.errors.ShortBufferError, keyczar.errors.ShortCiphertextError, keyczar.errors.ShortSignatureError

Indicates exceptions raised by a Keyczar class.

#### 2.1.1 Methods

*Inherited from exceptions.Exception*

`__init__()`, `__new__()`

*Inherited from exceptions.BaseException*

`__delattr__()`, `__getattr__()`, `__getitem__()`, `__getslice__()`, `__reduce__()`, `__repr__()`, `__setattr__()`, `__setstate__()`, `__str__()`

*Inherited from object*

`__hash__()`, `__reduce_ex__()`

#### 2.1.2 Properties

Name	Description
<i>Inherited from exceptions.BaseException</i>	
args, message	
<i>Inherited from object</i>	
__class__	

## 2.2 Class `BadVersionError`

Indicates a bad version number was received.

### 2.2.1 Methods

**`__init__`**(*self*, *version*)

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` `exitit` (inherited documentation)

*Inherited from `exceptions.Exception`*

`__new__`()

*Inherited from `exceptions.BaseException`*

`__delattr__`(), `__getattr__`(), `__getitem__`(), `__getslice__`(), `__reduce__`(), `__repr__`(),  
`__setattr__`(), `__setstate__`(), `__str__`()

*Inherited from `object`*

`__hash__`(), `__reduce_ex__`()

### 2.2.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
<code>args</code> , <code>message</code>	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 2.3 Class `BadFormatError`

Indicates a bad format number was received.

### 2.3.1 Methods

```
__init__(self, format)
```

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature  
 Overrides: `object.__init__` extit(inherited documentation)

*Inherited from `exceptions.Exception`*

```
__new__()
```

*Inherited from `exceptions.BaseException`*

```
__delattr__(), __getattr__(), __getitem__(), __getslice__(), __reduce__(), __repr__(),
__setattr__(), __setstate__(), __str__()
```

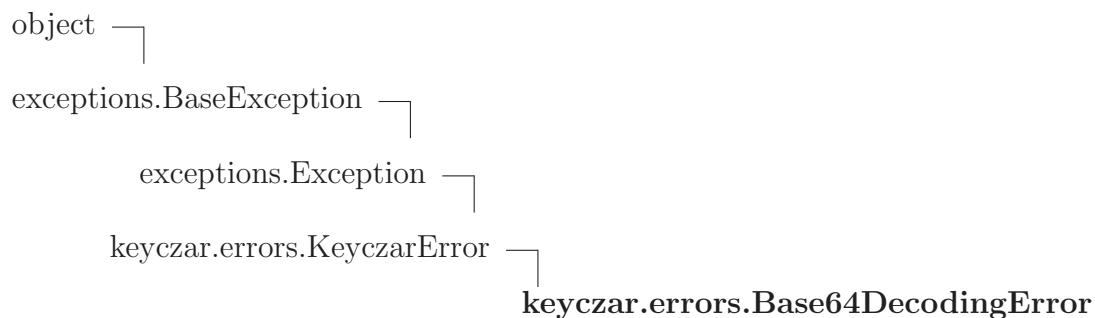

*Inherited from `object`*

```
__hash__(), __reduce_ex__()
```

### 2.3.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
<code>args</code> , <code>message</code>	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 2.4 Class Base64DecodingError

Indicates an error while performing Base 64 decoding.

### 2.4.1 Methods

*Inherited from exceptions.Exception*

`__init__()`, `__new__()`

*Inherited from exceptions.BaseException*

`__delattr__()`, `__getattr__()`, `__getitem__()`, `__getslice__()`, `__reduce__()`, `__repr__()`,  
`__setattr__()`, `__setstate__()`, `__str__()`

*Inherited from object*

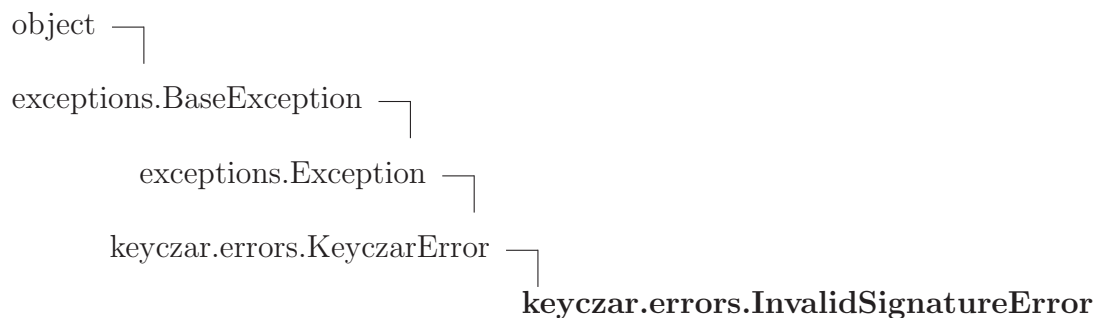

`__hash__()`, `__reduce_ex__()`

### 2.4.2 Properties

Name	Description
<i>Inherited from exceptions.BaseException</i>	
args, message	
<i>Inherited from object</i>	
<code>__class__</code>	

## 2.5 Class *InvalidSignatureError*

Indicates an invalid ciphertext signature.

### 2.5.1 Methods

```

__init__(self)

x.__init__(...) initializes x; see x.__class__.__doc__ for signature
Overrides: object.__init__ extit(inherited documentation)

```

*Inherited from exceptions.Exception*

```
__new__()
```

*Inherited from exceptions.BaseException*

```

__delattr__(), __getattr__(), __getitem__(), __getslice__(), __reduce__(), __repr__(),
__setattr__(), __setstate__(), __str__()

```

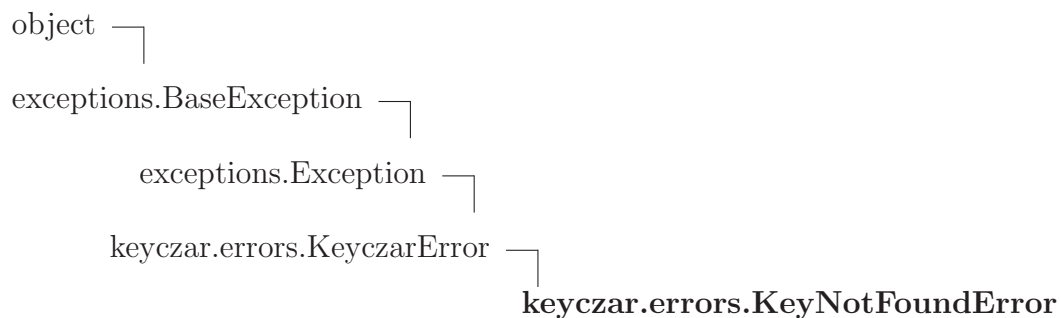

*Inherited from object*

```
__hash__(), __reduce_ex__()
```

### 2.5.2 Properties

Name	Description
<i>Inherited from exceptions.BaseException</i>	
args, message	
<i>Inherited from object</i>	
__class__	

## 2.6 Class `KeyNotFoundError`

**Known Subclasses:** `keyczar.errors.NoPrimaryKeyError`

Indicates a key with a certain hash id was not found.

### 2.6.1 Methods

`__init__(self, hash)`  
`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature  
 Overrides: `object.__init__` extit(inherited documentation)

*Inherited from `exceptions.Exception`*

`__new__()`

*Inherited from `exceptions.BaseException`*

`__delattr__()`, `__getattr__()`, `__getitem__()`, `__getslice__()`, `__reduce__()`, `__repr__()`,  
`__setattr__()`, `__setstate__()`, `__str__()`

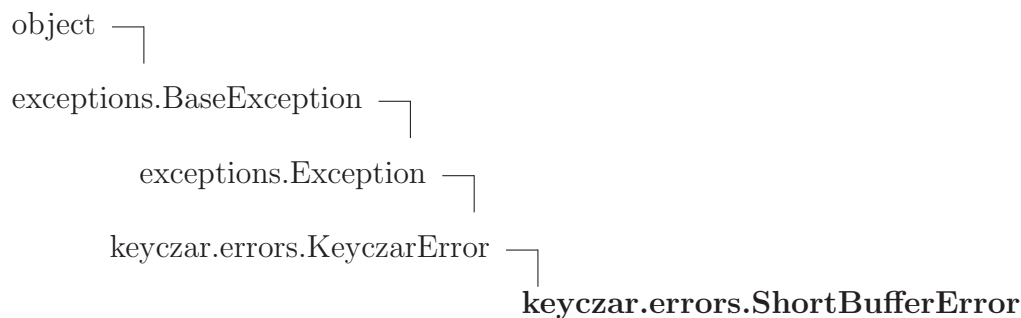

*Inherited from `object`*

`__hash__()`, `__reduce_ex__()`

### 2.6.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
args, message	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 2.7 Class `ShortBufferError`

Indicates a buffer with insufficient capacity.

### 2.7.1 Methods

**`__init__`**(*self*, *given*, *needed*)

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` `exitit`(inherited documentation)

*Inherited from `exceptions.Exception`*

`__new__`()

*Inherited from `exceptions.BaseException`*

`__delattr__`(), `__getattr__`(), `__getitem__`(), `__getslice__`(), `__reduce__`(), `__repr__`(),  
`__setattr__`(), `__setstate__`(), `__str__`()

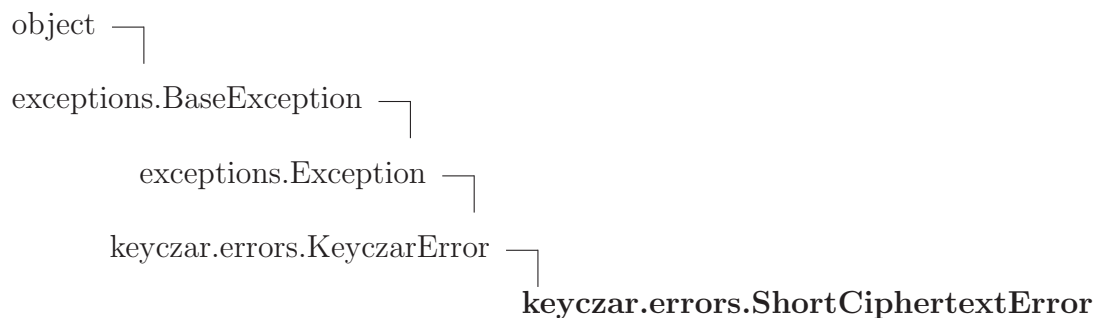

*Inherited from `object`*

`__hash__`(), `__reduce_ex__`()

### 2.7.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
<code>args</code> , <code>message</code>	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 2.8 Class ShortCiphertextError

Indicates a ciphertext too short to be valid.

### 2.8.1 Methods

**`__init__(self, length)`**  
`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature  
 Overrides: `object.__init__` extit(inherited documentation)

*Inherited from `exceptions.Exception`*

`__new__()`

*Inherited from `exceptions.BaseException`*

`__delattr__()`, `__getattr__()`, `__getitem__()`, `__getslice__()`, `__reduce__()`, `__repr__()`,  
`__setattr__()`, `__setstate__()`, `__str__()`

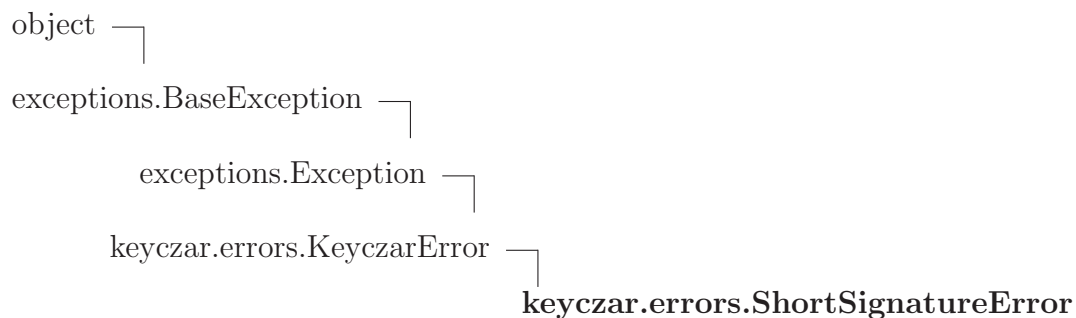

*Inherited from `object`*

`__hash__()`, `__reduce_ex__()`

### 2.8.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
<code>args</code> , <code>message</code>	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 2.9 Class ShortSignatureError

Indicates a signature too short to be valid.

### 2.9.1 Methods

**`__init__(self, length)`**  
`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature  
 Overrides: `object.__init__` `__init__(inherited documentation)`

*Inherited from `exceptions.Exception`*

`__new__()`

*Inherited from `exceptions.BaseException`*

`__delattr__()`, `__getattr__()`, `__getitem__()`, `__getslice__()`, `__reduce__()`, `__repr__()`,  
`__setattr__()`, `__setstate__()`, `__str__()`

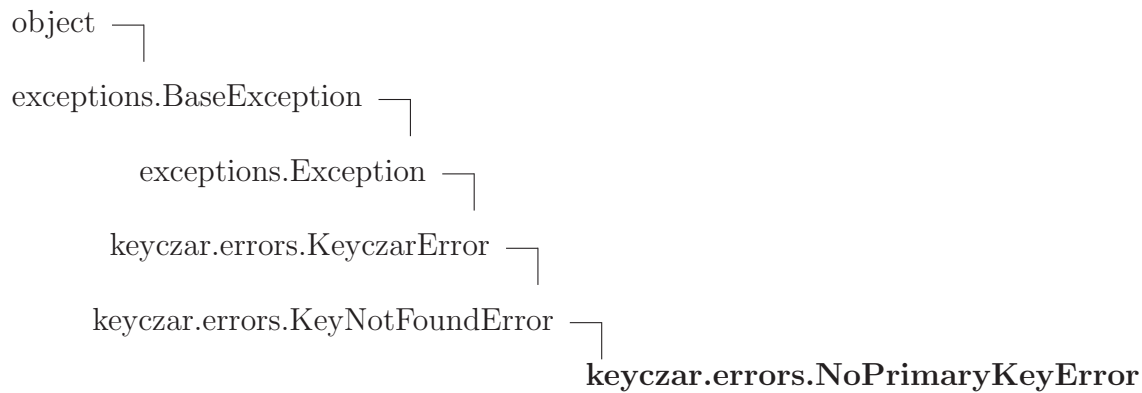

*Inherited from `object`*

`__hash__()`, `__reduce_ex__()`

### 2.9.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
<code>args</code> , <code>message</code>	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 2.10 Class NoPrimaryKeyError

Indicates missing primary key.

### 2.10.1 Methods

**`--init--(self)`**  
`x.--init--(...)` initializes `x`; see `x.--class--.--doc--` for signature  
 Overrides: `object.--init--` extit(inherited documentation)

*Inherited from `exceptions.Exception`*

`--new--()`

*Inherited from `exceptions.BaseException`*

`--delattr--()`, `--getattr--()`, `--getitem--()`, `--getslice--()`, `--reduce--()`, `--repr--()`,  
`--setattr--()`, `--setstate--()`, `--str--()`

*Inherited from `object`*

`--hash--()`, `--reduce_ex--()`

### 2.10.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
args, message	
<i>Inherited from <code>object</code></i>	
<code>--class--</code>	

### 3 Module keyczar.keyczar

Collection of all Keyczar classes used to perform cryptographic functions: encrypt, decrypt, sign and verify.

**Authors:** arkajit.dey@gmail.com (Arkajit Dey), steveweis@gmail.com (Steve Weis)

#### 3.1 Variables

Name	Description
VERSION	<b>Value:</b> 1
FORMAT	<b>Value:</b> 1
KEY_HASH_SIZE	<b>Value:</b> 4
HEADER_SIZE	<b>Value:</b> 6

#### 3.2 Class Keyczar

object └─  
keyczar.keyczar.Keyczar

**Known Subclasses:** keyczar.keyczar.Encrypter, keyczar.keyczar.GenericKeyczar, keyczar.keyczar.Verifier

Abstract Keyczar base class.

##### 3.2.1 Methods

**\_\_init\_\_**(*self*, *reader*)

*x*.**\_\_init\_\_**(...) initializes *x*; see *x*.**\_\_class\_\_**.**\_\_doc\_\_** for signature

Overrides: object.**\_\_init\_\_** extit(inherited documentation)

**\_\_str\_\_**(*self*)

**str**(*x*)

Overrides: object.**\_\_str\_\_** extit(inherited documentation)

**Read**(*location*)

Return a Keyczar object created from FileReader at given location.

**Parameters**

**location:** pathname of the directory storing the key files  
(*type=string*)

**Return Value**

a Keyczar to manage the keys stored at the given location  
(*type=Keyczar*)

**IsAcceptablePurpose**(*self, purpose*)

Indicates whether purpose is valid. Abstract method.

**GetKey**(*self, id*)

Returns the key associated with the given id, a hash or a version.

**Parameters**

**id:** Either the hash identifier of the key or its version.  
(*type=string or keydata.KeyVersion*)

**Return Value**

key associated with this id or None if id doesn't exist.  
(*type=keys.Key*)

**Raises**

KeyNotFoundError if key with given id doesn't exist

**AddVersion**(*self*, *status*, *size=None*)

Adds a new key version with given status to key set.

Generates a new key of same type (repeated until hash identifier is unique) for this version. Uses supplied key size (if provided) in lieu of the default key size. If this is an unacceptable key size, uses the default key size. Uses next available version number.

**Parameters**

**status:** the status of the new key to be added  
(*type=keyinfo.KeyStatus*)

**size:** size of key in bits, uses default size if not provided.  
(*type=integer*)

**Raises**

**KeyczarError** if key type unsupported

**Promote**(*self*, *version\_number*)

Promotes the status of key with given version number.

Promoting ACTIVE key automatically demotes current PRIMARY key to ACTIVE.

**Parameters**

**version\_number:** the version number to promote  
(*type=integer*)

**Raises**

**KeyczarError** if invalid version number or trying to promote a primary key

**Demote**(*self*, *version\_number*)

Demotes the status of key with given version number.

Demoting PRIMARY key results in a key set with no primary version.

**Parameters**

**version\_number:** the version number to demote  
(*type=integer*)

**Raises**

**KeyczarError** if invalid version number or trying to demote a key scheduled for revocation, use **Revoke** instead.

**Revoke**(*self*, *version\_number*)

Revokes the key with given version number if scheduled to be revoked.

**Parameters**

**version\_number**: integer version number to revoke  
(*type=integer*)

**Raises**

KeyczarError if invalid version number or key is not scheduled for revocation

**Inherited from object**

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

### 3.2.2 Properties

Name	Description
versions	List of versions in key set.
primary_key	The primary key for this key set.
<i>Inherited from object</i>	
__class__	

## 3.3 Class GenericKeyczar

To be used by Keyczart.

### 3.3.1 Methods

#### **Read**(*location*)

Return a GenericKeyczar created from FileReader at given location.

#### **Parameters**

**location:** pathname of the directory storing the key files

#### **Return Value**

a Keyczar to manage the keys stored at the given location

(*type=Keyczar*)

Overrides: keyczar.keyczar.Keyczar.Read

#### **IsAcceptablePurpose**(*self, purpose*)

All purposes ok for Keyczart.

Overrides: keyczar.keyczar.Keyczar.IsAcceptablePurpose

#### **PublicKeyExport**(*self, destination*)

Export the public keys corresponding to our key set to destination.

### *Inherited from keyczar.keyczar.Keyczar (Section 3.2)*

AddVersion(), Demote(), GetKey(), Promote(), Revoke(), \_\_init\_\_(), \_\_str\_\_()

### *Inherited from object*

\_\_delattr\_\_(), \_\_getattr\_\_(), \_\_hash\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(), \_\_repr\_\_(), \_\_setattr\_\_()

### 3.3.2 Properties

Name	Description
<i>Inherited from keyczar.keyczar.Keyczar (Section 3.2)</i>	
primary_key, versions	
<i>Inherited from object</i>	
__class__	

### 3.4 Class Encrypter

**Known Subclasses:** keyczar.keyczar.Crypter

Capable of encrypting only.

#### 3.4.1 Methods

##### **Read**(*location*)

Return an Encrypter object created from FileReader at given location.

##### **Parameters**

**location:** pathname of the directory storing the key files  
(*type=string*)

##### **Return Value**

an Encrypter to manage the keys stored at the given location and perform encryption functions.  
(*type=Encrypter*)

Overrides: keyczar.keyczar.Keyczar.Read

##### **IsAcceptablePurpose**(*self, purpose*)

Only valid if purpose includes encrypting.

Overrides: keyczar.keyczar.Keyczar.IsAcceptablePurpose

<b>Encrypt</b> ( <i>self</i> , <i>data</i> )
Encrypt the data and return the ciphertext.
<b>Parameters</b>
<b>data</b> : message to encrypt ( <i>type=string</i> )
<b>Return Value</b>
ciphertext encoded as a Base64 string ( <i>type=string</i> )
<b>Raises</b>
NoPrimaryKeyError if no primary key can be found to encrypt

### *Inherited from keyczar.keyczar.Keyczar (Section 3.2)*

AddVersion(), Demote(), GetKey(), Promote(), Revoke(), \_\_init\_\_(), \_\_str\_\_()

### *Inherited from object*

\_\_delattr\_\_(), \_\_getattr\_\_(), \_\_hash\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(),  
\_\_repr\_\_(), \_\_setattr\_\_()

### 3.4.2 Properties

Name	Description
<i>Inherited from keyczar.keyczar.Keyczar (Section 3.2)</i>	
primary_key, versions	
<i>Inherited from object</i>	
__class__	

## 3.5 Class Verifier

**Known Subclasses:** keyczar.keyczar.Signer

Capable of verifying only.

### 3.5.1 Methods

#### **Read**(*location*)

Return a Verifier object created from FileReader at given location.

##### **Parameters**

**location:** pathname of the directory storing the key files  
(*type=string*)

##### **Return Value**

a Verifier to manage the keys stored at the given location and perform verify functions.  
(*type=Verifier*)

Overrides: keyczar.keyczar.Keyczar.Read

#### **IsAcceptablePurpose**(*self, purpose*)

Only valid if purpose includes verifying.

Overrides: keyczar.keyczar.Keyczar.IsAcceptablePurpose

#### **Verify**(*self, data, sig*)

Verifies whether the signature corresponds to the given data.

##### **Parameters**

**data:** message that has been signed with sig  
(*type=string*)  
**sig:** Base64 string formatted as Header|Signature  
(*type=string*)

##### **Return Value**

True if sig corresponds to data, False otherwise.  
(*type=boolean*)

#### **Inherited from keyczar.keyczar.Keyczar(Section 3.2)**

AddVersion(), Demote(), GetKey(), Promote(), Revoke(), \_\_init\_\_(), \_\_str\_\_()

#### **Inherited from object**

\_\_delattr\_\_(), \_\_getattr\_\_(), \_\_hash\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(), \_\_repr\_\_(), \_\_setattr\_\_()

### 3.5.2 Properties

Name	Description
<i>Inherited from keyczar.keyczar.Keyczar (Section 3.2)</i>	
primary_key, versions	
<i>Inherited from object</i>	
__class__	

### 3.6 Class Crypter

Capable of encrypting and decrypting.

#### 3.6.1 Methods

<b>Read</b> ( <i>location</i> )
Return a Crypter object created from FileReader at given location.
<b>Parameters</b>
<i>location</i> : pathname of the directory storing the key files ( <i>type=string</i> )
<b>Return Value</b>
a Crypter to manage the keys stored at the given location and perform encryption and decryption functions. ( <i>type=Crypter</i> )
Overrides: keyczar.keyczar.Keyczar.Read

<b>IsAcceptablePurpose</b> ( <i>self, purpose</i> )
Only valid if purpose includes decrypting
Overrides: keyczar.keyczar.Keyczar.IsAcceptablePurpose

**Decrypt**(*self*, *ciphertext*)

Decrypts the given ciphertext and returns the plaintext.

**Parameters**

**ciphertext:** Base64 encoded string ciphertext to be decrypted.  
(*type=string*)

**Return Value**

plaintext message  
(*type=string*)

**Raises**

**ShortCiphertextError** if length is too short to have Header, IV, Sig  
**BadVersionError** if header specifies an illegal version  
**BadFormatError** if header specifies an illegal format  
**KeyNotFoundError** if key specified in header doesn't exist  
**InvalidSignatureError** if the signature can't be verified

*Inherited from keyczar.keyczar.Encrypter(Section 3.4)*

Encrypt()

*Inherited from keyczar.keyczar.Keyczar(Section 3.2)*

AddVersion(), Demote(), GetKey(), Promote(), Revoke(), \_\_init\_\_(), \_\_str\_\_()

*Inherited from object*

\_\_delattr\_\_(), \_\_getattr\_\_(), \_\_hash\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(),  
\_\_repr\_\_(), \_\_setattr\_\_()

### 3.6.2 Properties

Name	Description
<i>Inherited from keyczar.keyczar.Keyczar (Section 3.2)</i>	
primary_key, versions	
<i>Inherited from object</i>	
__class__	

### 3.7 Class *Signer*

Capable of both signing and verifying.

#### 3.7.1 Methods

##### **Read**(*location*)

Return a *Signer* object created from *FileReader* at given location.

##### **Parameters**

**location:** pathname of the directory storing the key files  
(*type=string*)

##### **Return Value**

a *Signer* to manage the keys stored at the given location and perform sign and verify functions.

(*type=Signer*)

Overrides: *keyczar.keyczar.Keyczar.Read*

##### **IsAcceptablePurpose**(*self, purpose*)

Only valid if purpose includes signing.

Overrides: *keyczar.keyczar.Keyczar.IsAcceptablePurpose*

##### **Sign**(*self, data*)

Sign given data and return corresponding signature.

##### **Parameters**

**data:** message to be signed  
(*type=string*)

##### **Return Value**

signature on the data encoded as a Base64 string

(*type=string*)

## 4 Module **keyczar.keyczart**

Keyczart(ool) is a utility for creating and managing Keyczar keysets.

**Author:** arkajit.dey@gmail.com (Arkajit Dey)

### 4.1 Functions

<code>usage()</code>
----------------------

<code>main(<i>argv</i>)</code>
--------------------------------

### 4.2 Class **KeyczarTool**

## 5 Module `keyczar.keydata`

Encodes the two classes storing data about keys:

- `KeyMetadata`: stores metadata
- `KeyVersion`: stores key strings and types

**Authors:** `arkajit.dey@gmail.com` (Arkajit Dey), `steveweis@gmail.com` (Steve Weis)

### 5.1 Class `KeyMetadata`

object —  
     `keyczar.keydata.KeyMetadata`

Encodes metadata for a keyset with a name, purpose, type, and versions.

#### 5.1.1 Methods

**`__init__(self, name, purpose, type)`**

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` `extit`(inherited documentation)

**`__str__(self)`**

`str(x)`

Overrides: `object.__str__` `extit`(inherited documentation)

**`AddVersion(self, version)`**

Adds given version and returns True if successful.

#### Parameters

**`version`:** version to add

(*type=KeyVersion*)

#### Return Value

True if version was successfully added (i.e. no previous version had the same version number), False otherwise.

(*type=boolean*)

**RemoveVersion**(*self*, *version\_number*)

Removes version with given version number and returns it if it exists.

**Parameters**

**version\_number**: version number to remove  
(*type=integer*)

**Return Value**

the removed version if it exists or None.  
(*type=KeyVersion*)

**GetVersion**(*self*, *version\_number*)

Return the version corresponding to the given version number.

**Parameters**

**version\_number**: integer version number of desired version  
(*type=integer*)

**Return Value**

the corresponding version if it exists  
(*type=KeyVersion*)

**Raises**

**KeyczarError** if the version number is non-existent.

**Read**(*json\_string*)

Return KeyMetadata object constructed from JSON string representation.

**Parameters**

**json\_string**: a JSON representation of a KeyMetadata object  
(*type=string*)

**Return Value**

the constructed KeyMetadata object  
(*type=KeyMetadata*)

**Inherited from object**

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

**5.1.2 Properties**

Name	Description
versions	
<i>Inherited from object</i>	
__class__	

## 5.2 Class *KeyVersion*

object └─  
          keyczar.keydata.*KeyVersion*

### 5.2.1 Methods

**\_\_init\_\_**(*self*, *v*, *s*, *export*)

*x*.\_\_init\_\_(...) initializes *x*; see *x*.\_\_class\_\_.\_\_doc\_\_ for signature

Overrides: object.\_\_init\_\_ extit(inherited documentation)

**\_\_str\_\_**(*self*)

str(*x*)

Overrides: object.\_\_str\_\_ extit(inherited documentation)

**Read**(*version*)

Return *KeyVersion* object constructed from dictionary derived from JSON.

**Parameters**

**version:** a dictionary obtained from a JSON string representation  
(*type=*dictionary)

**Return Value**

constructed *KeyVersion* object  
(*type=KeyVersion*)

### *Inherited from object*

\_\_delattr\_\_(), \_\_getattr\_\_(), \_\_hash\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(),  
\_\_repr\_\_(), \_\_setattr\_\_()

### 5.2.2 Properties

Name	Description
status	
<i>Inherited from object</i>	
__class__	

## 6 Module keyczar.keyinfo

Defines several 'enums' encoding information about keys, such as type, status, purpose, and the cipher mode.

**Authors:** arkajit.dey@gmail.com (Arkajit Dey), steveweis@gmail.com (Steve Weis)

### 6.1 Functions

<b>GetType</b> ( <i>name</i> )
--------------------------------

<b>GetStatus</b> ( <i>value</i> )
-----------------------------------

<b>GetPurpose</b> ( <i>name</i> )
-----------------------------------

<b>GetMode</b> ( <i>name</i> )
--------------------------------

### 6.2 Variables

Name	Description
AES	<b>Value:</b> KeyType("AES", 0, [128, 192, 256], 0)
HMAC_SHA1	<b>Value:</b> KeyType("HMAC_SHA1", 1, [256], 20)
DSA_PRIV	<b>Value:</b> KeyType("DSA_PRIV", 2, [1024], 48)
DSA_PUB	<b>Value:</b> KeyType("DSA_PUB", 3, [1024], 48)
RSA_PRIV	<b>Value:</b> KeyType("RSA_PRIV", 4, [2048, 1024, 768, 512], 256)
RSA_PUB	<b>Value:</b> KeyType("RSA_PUB", 4, [2048, 1024, 768, 512], 256)
types	<b>Value:</b> {"AES": AES, "HMAC_SHA1": HMAC_SHA1, "DSA_PRIV": DSA_PRIV...
PRIMARY	<b>Value:</b> KeyStatus("primary", 0)
ACTIVE	<b>Value:</b> KeyStatus("active", 1)
SCHEDULED_FOR_REVOCATION	<b>Value:</b> KeyStatus("scheduled_for_revocation", 2)
statuses	<b>Value:</b> {"PRIMARY": PRIMARY, "ACTIVE": ACTIVE, "SCHEDULED_FOR_REV..."}
DECRYPT_AND_ENCRYPT	<b>Value:</b> KeyPurpose("crypt", 0)

*continued on next page*

Name	Description
ENCRYPT	<b>Value:</b> KeyPurpose("encrypt", 1)
SIGN_AND_VERIFY	<b>Value:</b> KeyPurpose("sign", 2)
VERIFY	<b>Value:</b> KeyPurpose("verify", 3)
purposes	<b>Value:</b> {"DECRYPT_AND_ENCRYPT": DECRYPT_AND_ENCRYPT, "ENCRYPT": E...
CBC	<b>Value:</b> CipherMode("CBC", 0, True, lambda b, i:(i/ b+ 2)* b)
CTR	<b>Value:</b> CipherMode("CTR", 1, True, lambda b, i: i+ b/ 2)
ECB	<b>Value:</b> CipherMode("ECB", 2, False, lambda b, i: b)
DET_CBC	<b>Value:</b> CipherMode("DET_CBC", 3, False, lambda b, i:(i/ b+ 1)* b)
modes	<b>Value:</b> {"CBC": CBC, "CTR": CTR, "ECB": ECB, "DET_CBC": DET_CBC}

### 6.3 Class *KeyType*

Encodes different key types and their properties:

- AES
- HMAC-SHA1
- DSA Private
- DSA Public
- RSA Private
- RSA Public

#### 6.3.1 Methods

```

__init__(self, name, id, sizes, output_size)
x.__init__(...) initializes x; see x.__class__.__doc__ for signature
Overrides: object.__init__ extit(inherited documentation)

```

**IsValidSize**(*self*, *size*)

*Inherited from keyczar.keyinfo.\_NameId*

`__str__()`

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

### 6.3.2 Properties

Name	Description
sizes	List of valid key sizes for this key type.
<i>Inherited from object</i>	
__class__	

## 6.4 Class KeyStatus

Encodes the different possible statuses of a key:

- Primary: can be used to encrypt and sign new data
- Active: can be used to decrypt or verify data signed previously
- Scheduled for Revocation: can do the same functions as an active key, but status indicates that it is about to be revoked

### 6.4.1 Methods

*Inherited from keyczar.keyinfo.\_NameId*

`__init__()`, `__str__()`

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

### 6.4.2 Properties

Name	Description
<i>Inherited from object</i>	
<code>--class--</code>	

## 6.5 Class **KeyPurpose**

Encodes the different possible purposes for which a key can be used:

- Decrypt and Encrypt
- Encrypt (only)
- Sign and Verify
- Verify (only)

### 6.5.1 Methods

*Inherited from keyczar.keyinfo.\_NameId*

`--init--()`, `--str--()`

*Inherited from object*

`--delattr--()`, `--getattribute--()`, `--hash--()`, `--new--()`, `--reduce--()`, `--reduce_ex--()`, `--repr--()`, `--setattr--()`

### 6.5.2 Properties

Name	Description
<i>Inherited from object</i>	
<code>--class--</code>	

## 6.6 Class *CipherMode*

Encodes the different possible modes for a cipher:

- Cipher Block Chaining (CBC)
- Counter (CTR)
- Electronic Code Book (ECB)
- Cipher Block Chaining without IV (DET-CBC)

### 6.6.1 Methods

**`__init__`**(*self*, *name*, *id*, *use\_iv*, *OutputSizeFn*)

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` `extit`(inherited documentation)

*Inherited from `keyczar.keyinfo.NameId`*

`__str__`()

*Inherited from `object`*

`__delattr__`(), `__getattr__`(), `__hash__`(), `__new__`(), `__reduce__`(), `__reduce_ex__`(),  
`__repr__`(), `__setattr__`()

### 6.6.2 Properties

Name	Description
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 7 Module `keyczar.keys`

Represents cryptographic keys in Keyczar.

Identifies a key by its hash and type. Includes several subclasses of base class `Key`.

**Authors:** arkajit.dey@gmail.com (Arkajit Dey), steveweis@gmail.com (Steve Weis)

### 7.1 Functions

**GenKey**(*type*, *size*=None)

Generates a key of the given type and length.

**Parameters**

**type:** the type of key to generate

(*type*=`keyinfo.KeyType`)

**size:** the length in bits of the key to be generated

(*type*=`integer`)

**Return Value**

the generated key of the given type and size

**Raises**

`KeyczarError` if type is a public key or unsupported.

**ReadKey**(*type*, *key*)

Reads a key of the given type from a JSON string representation.

**Parameters**

**type:** the type of key to read

(*type*=`keyinfo.KeyType`)

**key:** the JSON string representation of the key

(*type*=`string`)

**Return Value**

the key object read from the JSON string

**Raises**

`KeyczarError` if type is unsupported

## 7.2 Class Key

**Known Subclasses:** keyczar.keys.SymmetricKey, keyczar.keys.AsymmetricKey

Parent class for Keyczar Keys.

### 7.2.1 Methods

**`--init--(self, type)`**

`x.--init--(...)` initializes x; see `x.__class__.__doc__` for signature

Overrides: `object.--init--` extit(inherited documentation)

**`Header(self)`**

Return the 6-byte header string including version, format, and hash.

*Inherited from object*

`--delattr--()`, `--getattr--()`, `--hash--()`, `--new--()`, `--reduce--()`, `--reduce_ex--()`,  
`--repr--()`, `--setattr--()`, `--str--()`

### 7.2.2 Properties

Name	Description
hash	The hash id of the key.
size	The size of the key in bits.
key_string	The key as a Base64 string.
key_bytes	The key as bytes.
<i>Inherited from object</i>	
<code>--class--</code>	

### 7.3 Class SymmetricKey

**Known Subclasses:** keyczar.keys.AesKey, keyczar.keys.HmacKey

Parent class for symmetric keys such as AES, HMAC-SHA1

#### 7.3.1 Methods

**`--init--(self, type, key_string)`**  
`x.__init__(...)` initializes x; see `x.__class__.__doc__` for signature  
 Overrides: `object.__init__` `exitit` (inherited documentation)

*Inherited from keyczar.keys.Key (Section 7.2)*

`Header()`

*Inherited from object*

`--delattr--()`, `--getattribute--()`, `--hash--()`, `--new--()`, `--reduce--()`, `--reduce_ex--()`,  
`--repr--()`, `--setattr--()`, `--str--()`

#### 7.3.2 Properties

Name	Description
<i>Inherited from keyczar.keys.Key (Section 7.2)</i>	
<code>hash</code> , <code>key_bytes</code> , <code>key_string</code> , <code>size</code>	
<i>Inherited from object</i>	
<code>--class--</code>	

### 7.4 Class AsymmetricKey

**Known Subclasses:** `keyczar.keys.PrivateKey`, `keyczar.keys.PublicKey`

Parent class for asymmetric keys.

#### 7.4.1 Methods

`__init__(self, type, params)`

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` `exitit` (inherited documentation)

*Inherited from `keyczar.keys.Key` (Section 7.2)*

`Header()`

*Inherited from `object`*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`, `__str__()`

#### 7.4.2 Properties

Name	Description
<i>Inherited from <code>keyczar.keys.Key</code> (Section 7.2)</i>	
<code>hash</code> , <code>key_bytes</code> , <code>key_string</code> , <code>size</code>	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

### 7.5 Class `AesKey`

Represents AES symmetric private keys.

### 7.5.1 Methods

```
__init__(self, key_string, hmac_key, size=128, mode=CipherMode("CBC", 0, True, lambda b, i:(i/ b+ 2)* b))
```

*x*.**\_\_init\_\_**(...) initializes *x*; see *x*.**\_\_class\_\_**.**\_\_doc\_\_** for signature

Overrides: object.**\_\_init\_\_** extit(inherited documentation)

```
__str__(self)
```

**str**(*x*)

Overrides: object.**\_\_str\_\_** extit(inherited documentation)

```
Generate(size=128)
```

Return a newly generated AES key.

**Parameters**

**size**: length of key in bits to generate  
(*type*=*integer*)

**Return Value**

an AES key  
(*type*=*AesKey*)

```
Read(key)
```

Reads an AES key from a JSON string representation of it.

**Parameters**

**key**: a JSON representation of an AES key  
(*type*=*string*)

**Return Value**

an AES key  
(*type*=*AesKey*)

**Encrypt**(*self*, *data*)

Return ciphertext byte string containing Header|IV|Ciph|Sig.

**Parameters**

**data:** plaintext to be encrypted.  
(*type=string*)

**Return Value**

raw byte string ciphertext formatted to have Header|IV|Ciph|Sig.  
(*type=string*)

**Decrypt**(*self*, *input\_bytes*)

Decrypts the given ciphertext.

**Parameters**

**input\_bytes:** raw byte string formatted as Header|IV|Ciph|Sig  
where Sig is the signature over the entire payload  
(Header|IV|Ciph).  
(*type=string*)

**Return Value**

plaintext message  
(*type=string*)

**Raises**

`ShortCiphertextError` if the ciphertext is too short to have IV &  
Sig  
`InvalidSignatureError` if the signature doesn't correspond to  
payload

*Inherited from `keyczar.keys.Key` (Section 7.2)*

`Header()`

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

**7.5.2 Properties**

Name	Description
<i>Inherited from <code>keyczar.keys.Key</code> (Section 7.2)</i>	
hash, key_bytes, key_string, size	
<i>Inherited from object</i>	

*continued on next page*

Name	Description
<code>--class--</code>	

## 7.6 Class **HmacKey**

object └

keyczar.keys.Key └

keyczar.keys.SymmetricKey └  
**keyczar.keys.HmacKey**

Represents HMAC-SHA1 symmetric private keys.

### 7.6.1 Methods

**`--init--`**(*self*, *key\_string*, *size*=256)

*x*.`--init--`(...) initializes *x*; see *x*.`--class--`.`--doc--` for signature

Overrides: object.`--init--` extit(inherited documentation)

**`--str--`**(*self*)

`str`(*x*)

Overrides: object.`--str--` extit(inherited documentation)

**`Generate`**(*size*=256)

Return a newly generated HMAC-SHA1 key.

#### Parameters

**size:** length of key in bits to generate  
*(type=integer)*

#### Return Value

an HMAC-SHA1 key  
*(type=HmacKey)*

**Read**(*key*)

Reads an HMAC-SHA1 key from a JSON string representation of it.

**Parameters**

**key:** a JSON representation of an HMAC-SHA1 key  
*(type=string)*

**Return Value**

an HMAC-SHA1 key  
*(type=HmacKey)*

**Sign**(*self, msg*)

Return raw byte string of signature on the message.

**Parameters**

**msg:** message to be signed  
*(type=string)*

**Return Value**

raw byte string signature  
*(type=string)*

**Verify**(*self, msg, sig\_bytes*)

Return True if the signature corresponds to the message.

**Parameters**

**msg:** message that has been signed  
*(type=string)*

**sig\_bytes:** raw byte string of the signature  
*(type=string)*

**Return Value**

True if signature is valid for message. False otherwise.  
*(type=boolean)*

*Inherited from keyczar.keys.Key(Section 7.2)*

Header()

*Inherited from object*

`--delattr--()`, `--getattribute--()`, `--hash--()`, `--new--()`, `--reduce--()`, `--reduce_ex--()`,  
`--repr--()`, `--setattr--()`

### 7.6.2 Properties

Name	Description
<i>Inherited from keyczar.keys.Key (Section 7.2)</i>	hash, key_bytes, key_string, size
<i>Inherited from object</i>	__class__

## 7.7 Class PrivateKey

**Known Subclasses:** keyczar.keys.DsaPrivateKey, keyczar.keys.RsaPrivateKey

Represents private keys in Keyczar for asymmetric key pairs.

### 7.7.1 Methods

```
__init__(self, type, params, pkcs8, pub)

x.__init__(...) initializes x; see x.__class__.__doc__ for signature
Overrides: object.__init__ extit(inherited documentation)
```

```
__str__(self)

str(x)
Overrides: object.__str__ extit(inherited documentation)
```

*Inherited from keyczar.keys.Key(Section 7.2)*

Header()

*Inherited from object*

```
__delattr__(), __getattr__(), __hash__(), __new__(), __reduce__(), __reduce_ex__(),
__repr__(), __setattr__()
```

### 7.7.2 Properties

Name	Description
<i>Inherited from <code>keyczar.keys.Key</code> (Section 7.2)</i>	<code>hash</code> , <code>key_bytes</code> , <code>key_string</code> , <code>size</code>
<i>Inherited from object</i>	<code>__class__</code>

## 7.8 Class `PublicKey`

**Known Subclasses:** `keyczar.keys.DsaPublicKey`, `keyczar.keys.RsaPublicKey`

Represents public keys in Keyczar for asymmetric key pairs.

### 7.8.1 Methods

```
__init__(self, type, params, x509)
```

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature  
 Overrides: `object.__init__` extit(inherited documentation)

```
__str__(self)
```

`str(x)`  
 Overrides: `object.__str__` extit(inherited documentation)

*Inherited from `keyczar.keys.Key` (Section 7.2)*

`Header()`

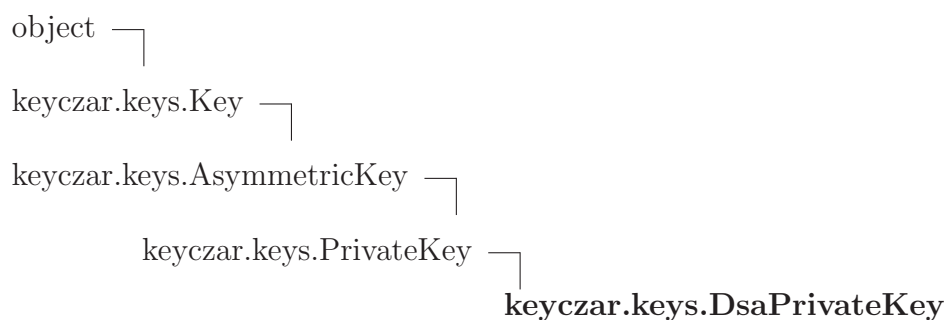

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

### 7.8.2 Properties

Name	Description
<i>Inherited from <code>keyczar.keys.Key</code> (Section 7.2)</i>	<code>hash</code> , <code>key_bytes</code> , <code>key_string</code> , <code>size</code>
<i>Inherited from object</i>	<code>__class__</code>

## 7.9 Class *DsaPrivateKey*

Represents DSA private keys in an asymmetric DSA key pair.

### 7.9.1 Methods

**`__init__(self, params, pkcs8, pub, key, size=1024)`**

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` `exitit`(inherited documentation)

**`Generate(size=1024)`**

Return a newly generated DSA private key.

**Parameters**

**`size`:** length of key in bits to generate  
*(type=integer)*

**Return Value**

a DSA private key  
*(type=DsaPrivateKey)*

**Read**(*key*)

Reads a DSA private key from a JSON string representation of it.

**Parameters**

**key**: a JSON representation of a DSA private key  
*(type=string)*

**Return Value**

an DSA private key  
*(type=DsaPrivateKey)*

**Sign**(*self, msg*)

Return raw byte string of signature on the message.

**Parameters**

**msg**: message to be signed  
*(type=string)*

**Return Value**

signature formatted as r|s where r and s are the long ints in the DSA signature tuple (r,s).  
*(type=string)*

**Verify**(*self, msg, sig*)

See Also: *DsaPublicKey.Verify*

*Inherited from keyczar.keys.PrivateKey(Section 7.7)*

`__str__()`

*Inherited from keyczar.keys.Key(Section 7.2)*

`Header()`

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

### 7.9.2 Properties

Name	Description
<i>Inherited from keyczar.keys.Key (Section 7.2)</i>	
hash, key_bytes, key_string, size	

*continued on next page*

Name	Description
<i>Inherited from object</i>	
<code>--class--</code>	

## 7.10 Class *RsaPrivateKey*

Represents RSA private keys in an asymmetric RSA key pair.

### 7.10.1 Methods

**`--init--`**(*self*, *params*, *pkcs8*, *pub*, *key*, *size*=2048)

*x*.`--init--`(...) initializes *x*; see *x*.`--class--`.`--doc--` for signature

Overrides: *object*.`--init--` *extit*(inherited documentation)

**`Generate`**(*size*=2048)

Return a newly generated RSA private key.

#### Parameters

**size**: length of key in bits to generate

(*type*=*integer*)

#### Return Value

a RSA private key

(*type*=*RsaPrivateKey*)

**Read**(*key*)

Reads a RSA private key from a JSON string representation of it.

**Parameters**

**key:** a JSON representation of a RSA private key  
(*type=string*)

**Return Value**

a RSA private key  
(*type=RsaPrivateKey*)

**Encrypt**(*self, data*)

See **Also:** *RsaPublicKey.Encrypt*

**Decrypt**(*self, input\_bytes*)

Decrypts the given ciphertext.

**Parameters**

**input\_bytes:** raw byte string formatted as Header|Ciphertext.  
(*type=string*)

**Return Value**

plaintext message  
(*type=string*)

**Sign**(*self, msg*)

Return raw byte string of signature on the message.

**Parameters**

**msg:** message to be signed  
(*type=string*)

**Return Value**

string representation of long int signature over message  
(*type=string*)

**Verify**(*self, msg, sig*)

See **Also:** *RsaPublicKey.Verify*

*Inherited from keyczar.keys.PrivateKey(Section 7.7)*

`__str__()`

***Inherited from keyczar.keys.Key(Section 7.2)***

Header()

***Inherited from object***

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

**7.10.2 Properties**

Name	Description
<i>Inherited from keyczar.keys.Key (Section 7.2)</i>	hash, key_bytes, key_string, size
<i>Inherited from object</i>	<code>__class__</code>

**7.11 Class DsaPublicKey**

Represents DSA public keys in an asymmetric DSA key pair.

**7.11.1 Methods**

<b><code>__init__(self, params, x509, key, size=1024)</code></b>
<code>x.__init__(...)</code> initializes x; see <code>x.__class__.__doc__</code> for signature
Overrides: <code>object.__init__</code> <code>exitit</code> (inherited documentation)

**Read**(*key*)

Reads a DSA public key from a JSON string representation of it.

**Parameters**

**key**: a JSON representation of a DSA public key  
*(type=string)*

**Return Value**

a DSA public key  
*(type=DsaPublicKey)*

**Verify**(*self, msg, sig*)

Return True if the signature corresponds to the message.

**Parameters**

**msg**: message that has been signed  
*(type=string)*

**sig**: raw byte string of the signature formatted as r|s  
*(type=string)*

**Return Value**

True if signature is valid for message. False otherwise.  
*(type=boolean)*

*Inherited from keyczar.keys.PublicKey(Section 7.8)*

`__str__()`

*Inherited from keyczar.keys.Key(Section 7.2)*

`Header()`

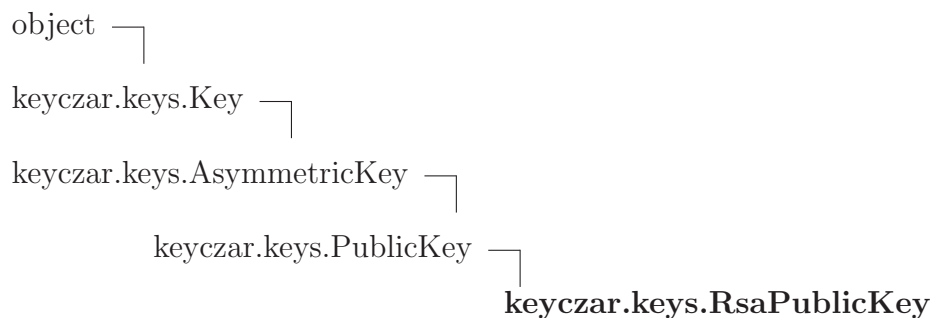

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

### 7.11.2 Properties

Name	Description
<i>Inherited from keyczar.keys.Key (Section 7.2)</i>	
hash, key_bytes, key_string, size	
<i>Inherited from object</i>	
<code>__class__</code>	

## 7.12 Class *RsaPublicKey*

Represents RSA public keys in an asymmetric RSA key pair.

### 7.12.1 Methods

**`__init__(self, params, x509, key, size=2048)`**

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` extit(inherited documentation)

**`Read(key)`**

Reads a RSA public key from a JSON string representation of it.

**Parameters**

**key:** a JSON representation of a RSA public key  
*(type=string)*

**Return Value**

a RSA public key  
*(type=RsaPublicKey)*

**`Encrypt(self, data)`**

Return a raw byte string of the ciphertext in the form Header|Ciph.

**Parameters**

**data:** message to be encrypted  
*(type=string)*

**Return Value**

ciphertext formatted as Header|Ciph  
*(type=string)*

**Verify**(*self*, *msg*, *sig*)

Return True if the signature corresponds to the message.

**Parameters**

**msg**: message that has been signed

(*type=string*)

**sig**: string representation of long int signature

(*type=string*)

**Return Value**

True if signature is valid for message. False otherwise.

(*type=boolean*)

*Inherited from keyczar.keys.PublicKey(Section 7.8)*

`__str__()`

*Inherited from keyczar.keys.Key(Section 7.2)*

`Header()`

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`

### 7.12.2 Properties

Name	Description
<i>Inherited from keyczar.keys.Key (Section 7.2)</i>	
hash, key_bytes, key_string, size	
<i>Inherited from object</i>	
<code>__class__</code>	

## 8 Module keyczar.readers

A Reader supports reading metadata and key info for key sets.

**Authors:** arkajit.dey@gmail.com (Arkajit Dey), steveweis@gmail.com (Steve Weis)

### 8.1 Class Reader

object └─  
          keyczar.readers.Reader

**Known Subclasses:** keyczar.readers.FileReader

Interface providing supported methods (no implementation).

#### 8.1.1 Methods

##### **GetMetadata(*self*)**

Return the KeyMetadata for the key set being read.

##### **Return Value**

JSON string representation of KeyMetadata object  
(*type=string*)

##### **GetKey(*self*, *version\_number*)**

Return the key corresponding to the given version.

##### **Parameters**

**version\_number:** the version number of the desired key  
(*type=integer*)

##### **Return Value**

JSON string representation of a Key object  
(*type=string*)

*Inherited from object*

`__delattr__()`, `__getattr__()`, `__hash__()`, `__init__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`, `__str__()`

#### 8.1.2 Properties

Name	Description
<i>Inherited from object</i>	
<code>__class__</code>	

## 8.2 Class `FileReader`

Reader that reads key data from files.

### 8.2.1 Methods

**`__init__(self, location)`**

`x.__init__(...)` initializes `x`; see `x.__class__.__doc__` for signature

Overrides: `object.__init__` extit(inherited documentation)

**`GetMetadata(self)`**

Return the `KeyMetadata` for the key set being read.

**Return Value**

JSON string representation of `KeyMetadata` object

(*type=string*)

Overrides: `keyczar.readers.Reader.GetMetadata` extit(inherited documentation)

**`GetKey(self, version_number)`**

Return the key corresponding to the given version.

**Parameters**

**`version_number`:** the version number of the desired key

**Return Value**

JSON string representation of a `Key` object

(*type=string*)

Overrides: `keyczar.readers.Reader.GetKey` extit(inherited documentation)

***Inherited from object***

`__delattr__()`, `__getattr__()`, `__hash__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`,  
`__repr__()`, `__setattr__()`, `__str__()`

**8.2.2 Properties**

Name	Description
<i>Inherited from object</i>	
<code>__class__</code>	

## 9 Module `keyczar.util`

Utility functions for `keyczar` package.

**Author:** `arkajit.dey@gmail.com` (Arkajit Dey)

### 9.1 Functions

<b>ParsePkcs8</b> ( <i>pkcs8</i> )
------------------------------------

<b>ExportRsaPkcs8</b> ( <i>params</i> )
---

<b>ExportDsaPkcs8</b> ( <i>params</i> )
---

<b>ParseX509</b> ( <i>x509</i> )
----------------------------------

<b>ExportRsaX509</b> ( <i>params</i> )
--

<b>ExportDsaX509</b> ( <i>params</i> )
--

<b>BinToBytes</b> ( <i>bits</i> )
-----------------------------------

Convert bit string to byte string.
------------------------------------

<b>BytesToBin</b> ( <i>bytes</i> )
------------------------------------

Convert byte string to bit string.
------------------------------------

<b>IntToBin</b> ( <i>n</i> )
------------------------------

<b>IntToBytes</b> ( <i>n</i> )
--------------------------------

Return byte string of 4 big-endian ordered bytes representing <i>n</i> .
--

<b>RandBytes</b> ( <i>n</i> )
-------------------------------

Return <i>n</i> random bytes.
-------------------------------

<b>Hash</b> ( <i>inputs</i> )
-------------------------------

Return a SHA-1 hash over a list of inputs.
--

**Encode(*s*)**

Return Base64 encoding of *s*. Suppress padding characters (=).

Uses URL-safe alphabet: - replaces +, \_ replaces /. Will convert *s* of type unicode to string type first.

**Parameters**

*s*: string to encode as Base64  
(*type=string*)

**Return Value**

Base64 representation of *s*.  
(*type=string*)

**Decode(*s*)**

Return decoded version of given Base64 string. Ignore whitespace.

Uses URL-safe alphabet: - replaces +, \_ replaces /. Will convert *s* of type unicode to string type first.

**Parameters**

*s*: Base64 string to decode  
(*type=string*)

**Return Value**

original string that was encoded as Base64  
(*type=string*)

**Raises**

**Base64DecodingError** If length of string (ignoring whitespace) is one more than a multiple of four.

## 9.2 Variables

Name	Description
RSA_OID	<b>Value:</b> ObjectIdentifier('1.2.840.113549.1.1.1')
RSA_PARAMS	<b>Value:</b> ['n', 'e', 'd', 'p', 'q', 'dp', 'dq', 'invq']
DSA_OID	<b>Value:</b> ObjectIdentifier('1.2.840.10040.4.1')
DSA_PARAMS	<b>Value:</b> ['p', 'q', 'g']
